

Data Preparation

- **Legal corpus:** 24 complaints → 9,000 paragraphs.
- **Media corpus:** 807 articles → 31,662 paragraphs.

Surface-level Analysis

- Dictionary tagging on the word stems of “addiction” and “attachment” in each corpus
- **Output:** each media and legal paragraph labeled as having **surface meaning** of *addiction*, *attachment*, *both*, or *neither*.

Deeper-level Analysis

- Two LLM classifiers based on GPT-5.4: (1) Legal corpus classifier (2) Media corpus classifier
- Each LLM classifier provided with (1) psychologically-informed instructions and (2) hand-coded few-shot examples
 - Few-shot examples: 38 legal paragraphs (legal classifier only) and 39 media paragraphs (media classifier only)
- Legal classifier applied to entire legal corpus; Media classifier to entire media corpus
- **Output:** each media and legal paragraph labeled as having **deeper meaning** of *addiction*, *attachment*, *both*, or *neither*.

Validation

- **Within-LLM reliability:** Two runs of the LLM classifier for each corpus; $\kappa = 0.90$ for legal and $\kappa = 0.89$ for media
- **LLM-vs-Human reliability:**
 - 150 media paragraphs & 150 legal paragraphs hand-coded by two human raters
 - After adjudicating disagreements between human raters, LLM vs human reliability computed
 - $\kappa = 0.81$ for legal and $\kappa = 0.80$ for media
